4. Conclusion

Background

The photoacoustic (PA) effect is the physical basis for PAT

Light illumination, Light absorption, Temperature rise, Thermoelastic expansion, Ultrasonic emission

1. Background

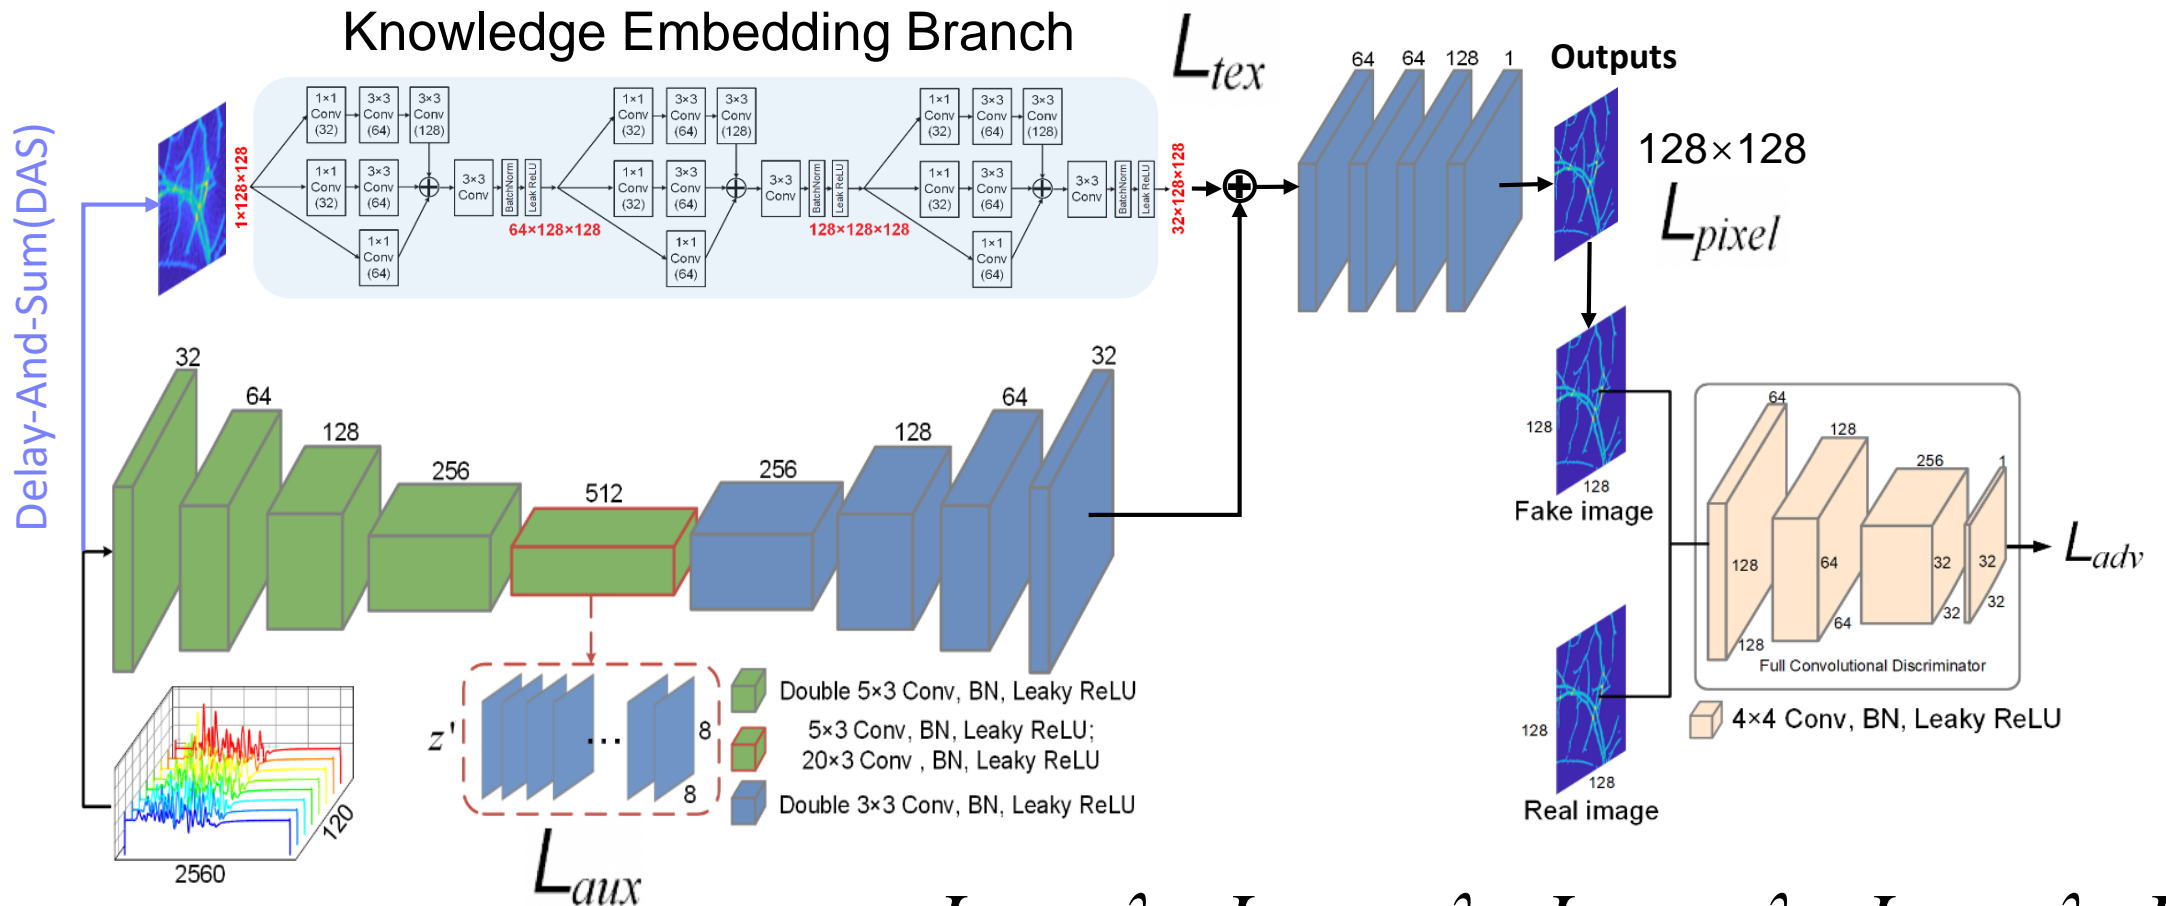

2. Methodology

3. Experiments and Results

4. Conclusion

- The sample is placed in the 38.4×38.4 mm region;
- 120 transducers are placed around the target as a circle;
- The MATLAB toolbox k-Wave is used to generate the training data;
- Full-sampled and sparse-sampled data are used to validate our method;
- *In-vivo* data are also validated in our method.

Ablation study

Table 1. Evaluation results of different models for the test sets (full-sampled data). U-Net¹: input the signals and resize to concatenation, U-Net²: input the result of DAS, AE#1: Auto-Encoder, AE#2: AE#1 with PSSIK, AE#3:AE#2 with Image Feature Supervision, AE#4: AE#3 with Embedded Certified Knowledge.

	DAS	U-Net ¹	U-Net ²	AE#1	AE#2	AE#3	AE#4	Ki-GAN
SSIM	0.2159	0.6453	0.8749	0.6519	0.6818	0.6931	0.9123	0.9285
PSNR	15.6176	18.4519	24.0175	18.7033	19.1193	19.1529	24.8951	25.5115
SNR	1.6386	4.3237	10.1285	4.7243	5.1403	5.1739	10.6161	11.5324

Results

Full-sampled data
120 channels

Results

Sparse-sampled data
40 channels

Table 2. Evaluation results of different models for the test sets (sparse-sampled data).

	DAS	U-Net	Ki-GAN
SSIM	0.1842	0.8174	0.8617
PSNR	15.5123	21.348	22.7398
SNR	1.5333	7.4689	8.7607

Results

10 iterations

U-Net

Ki-GAN

The vessel imaging of rat thigh.
(120 channels)

1. Background

2. Methodology

3. Experiments and Results

4. Conclusion

- The artifacts are essential to sparse-view photoacoustic tomography for conventional algorithms;
- We proposed Ki-GAN to reconstruct the PA image by infusing knowledge, and combine the conventional reconstruction with deep learning;
- This approach fills the gap between existing direct-processing and post-processing methods;
- A main texture come from the KEB; The latent features come from Auto-Encoder.
